

Pressure Film ensures precise mating between mold halves.

November 23, 2010 - Mold-Align®, when placed between mold halves during injection molding, changes color to reveal how pressure is being distributed between A and B halves of mold. It is placed between platens on parting line which are then subjected to pressure upon clamp closing, using minimal clamp tonnage. After product is removed, image is inspected for pressure distribution and void spots. Product may be archived and used as control for comparative purposes.

Pressure Film ensures precise mating between mold halves.
