Measure Nip Width at 30 Points

Sensor Products, Madison, NJ ;973/884-1755;

www.sensorprod.com

The Sigma-Nip second-generation electronic sensor and software diagnostic maintenance tool for measuring nip width has sensors deployed on the nip surface, giving instantaneous real-time feedback on nip condition. Sensors, said to be durable and long-lasting, can measure and detect nip widths at up to 30 discrete points over the cross-direction. Software interface allows for comparative analysis and detailed adjustments while sensor is in the closed (non-rotating) nip.
