

THE POWER OF IMAGE PROCESSING

Comparison of Tactilus® Versus a Competitor's Image

Competitor's Image

Competitor systems have to rely upon a greater number of sensing points to achieve even a close facsimile of the image detail generated by the Tactilus® system, which adds to the system cost.

Tactilus® Image

Tactilus® offers a variety of sophisticated optical imaging features that allow the user unprecedented control over the graphical image view. Now for example the user can choose the type of interpolation they desire whether Smart Gaussian or Low Pass filtering as well as the strength they wish to apply.

By virtue of the Tactilus® intelligent algorithms, we are able to reduce the number of physical scan lines required. Thus, the end user price is decreased, while providing the same data as is captured by systems with more lines.
